

Level decision

Before you go · Complete after B-1, before any equipment is bought

Decide how far up the tool spectrum this deployment goes — driven by what the hospital can sustain after you leave, not by need.

Hospital	Unit / area	Completed by	Date

1. The stop rule — tick every statement that is TRUE

If ANY box is ticked, drop a level or do not deploy. Dropping a level is not a defeat.

- ☐ No named person is paid to keep the system running after we leave — not 'someone will look after it' — a name, a role, a salary line
- ☐ The medical director has not personally endorsed the project — an administrator's enthusiasm is not the same authority
- ☐ There is no route to fund maintenance for five years — hardware fails, software needs patching, someone must be paid
- ☐ The unit we intend to digitise has no verified working power AND network — verified by us, in the room, with a device
- ☐ We cannot retire the paper process for what we are deploying — if paper continues alongside, nothing has been digitised

2. The tool spectrum

Level	Scope	Tools	Minimum to keep it alive
1	Data collection & surveys	KoBoToolbox, ODK	A trained clerk; no server on a hosted instance
2	Aggregate reporting & case tracking	DHIS2, CommCare	A reporting officer; alignment with the national system
3	Clinical EMR	OpenMRS	A part-time IT person; reliable power where clinicians work
4	Full HIS — clinical, lab, pharmacy, billing	Bahmni, GNU Health	A paid full-time IT person, a funded five-year owner, a support arrangement

3. Decision

Level chosen (1–4, or 'do not deploy')	B-1 total score	Decided by (names)	Date

Justification — why this level and not the one above:

If we deploy below what was hoped: what has to become true for next year's answer to be higher?

That last line is a prediction with a date on it. Next year's team is asked whether it came true — so write something that can be checked.

4. Stop-rule override — complete this ONLY if you ticked a box in section 1 and are deploying anyway

This is the most important section on the form. In 2026 at Lunsar every stop-rule condition was true and a level-4 system was deployed by careful engineers with reasons that were never written down. An override is sometimes right. An unrecorded override is how a decision becomes invisible to everyone who comes after.

Which conditions were true	Deploying anyway?	Decided by (names, roles)	Date
	Yes / No		

On what grounds — the actual reasoning, not the conclusion:

What is being put in place to compensate, and who is accountable for it:

What would have to be true for us to reverse this decision, and who reviews it:
